

## Abstract

Employee shift data analysis method and system. Time records and corresponding labor codes are received concerning one or more employees. That data, along with actual revenue and expenses data, is held in a database and is correlated and compared with a budgeted entry  
5 in that database. Further comparisons can take place with respect to historical data that is compiled by the system based upon information gathered through the use of the system. The labor code preferably serves as the identifier for determining which entries should be compared. The display occurs through a conventional computer monitor or a printout of the report, both either locally or remotely.
